INTERNET RACING RELAY SYSTEM AND METHOD

Representative drawing

(57) Abstract:

PURPOSE: An internet racing relay system and the method are provided so that users can watch all scenes of the racing through their personal computers graphically by transmitting location data through the internet after tracing all the locations of racers.

CONSTITUTION: If a main server approves the connection of a user, the user configures a watching screen on his PC(101). If the user selects a racer and bets on him, the main server approves the betting after confirming the selected racer s ID and the user s cyber money (103). The main server transmits location coordinates values by racer ID s, received from an input server, to the user PC (105). The user PC, receiving the location coordinates values,

processes the movement of each character corresponding to each ID graphically and displays it on the screen(107). If the racing is finished, the input server photographs and transmits an actual final scene, the main server executes data processing for the photographed image and transmits it to the user PC(109). If the input server determines ranking and transmits the result to the main server, the main server calculates a dividend for the user's betting according to ID ranking and reserves it in a cyber money DB(111).
